Pain is highly prevalent in both pre- and postoperative periods in patients with unstable angina or myocardial infarction undergoing major orthopedic surgery. Preoperative careful evaluation of the status of the heart and chest is crucial to avoid perioperative complications. The preoperative preparation, the pre- and intraoperative analgesia, and postoperative pain management are described. Most studies on general anesthesia have demonstrated a high incidence of cardiovascular complications and respiratory depression in these patients. In addition, the i.v. administration of opioids can provoke hypertension, especially in patients with unstable angina or a reversible left ventricular dysfunction. Local anaesthetic techniques might be associated with fewer postoperative complications than opioid-based multimodal analgesia. In the postoperative period, pain control is based on non-opioid analgesics, mainly NSAIDs, gabapentin, and acetaminophen. Intravenous or epidural opioids are commonly used when breakthrough pain occurs.--- title: Options.AllowPeriodicNotifications Property (Word) keywords: vbawd10.chm168767994 f1_keywords: - vbawd10.chm168767994 ms.prod: word api_name: - Word.Options.AllowPeriodicNotifications ms.assetid: e44c198c-f5f7-a5c6-4839-ff99fb6888c ms.date: 06/08/2017 --- # Options.AllowPeriodicNotifications Property (Word) Returns or sets a **Boolean** value indicating whether a user can select a set of words to be notified about often.
