The present invention relates generally to the field of protection of the material of pipe-type heat exchangers. In particular, the present invention relates to a device capable of protecting the material of a pipe-type heat exchanger used in refrigerant compressors by preventing sludge to be deposited due to the condensation of compressor servicing, i.e. the periodic removal of the compressor head, and its associated heating during reassembly. Pipe-type heat exchangers are widely used in refrigerant compressors, in this art, which are manufactured and used to assemble. The heat exchanger 2, interposed between the refrigerant compressor and the refrigerant condenser. The purpose of the heat exchanger 2 is to transfer the heat from the refrigerant passing through 1 to the ambient air, thus condensing the refrigerant fluid in a gaseous state, including the separation of liquid and gas. FIG. 1 shows a block diagram of a gas refrigerator unit comprising a refrigerant compressor 1, a condenser 2, a pipe-type heat exchanger (herein referred to as the primary heat exchanger) 3, and an evaporator 4. The primary heat exchanger 3 is interposed between the compressor 1 and the condenser 2. A portion of the heat generated by the compressor 1 passes through the primary heat exchanger 3 and is subsequently transferred to the condenser 2, where the heat is dissipated to the ambient air. On the other hand, the remaining heat, that does not pass through the primary heat exchanger 3, is transferred to the evaporator 4, where the heat is dissipated to the ambient air. FIG. 2 is a cross-sectional view of a conventional pipe-type heat exchanger. The heat exchanger is generally formed from a tube and

The following step is to calculate the sum of the areas in each stage: Calculate the areas of each stage until some number smaller than 10. You might need to stop if the program says that the answer is too large; otherwise, it may keep going forever. After that, you'll have to sort the stages by their value and then combine the first two stages: Now, you're ready to calculate the sum of the areas in each stage. Start by summing the areas of the first stage. Now you have to combine the sum of the first stage and the sum of the second stage (by subtracting the sum of the first stage from the sum of the second stage). Repeat this process until you've summed all the areas.
